AB The invention pertains to a method for preparing diphenhydramine tannate by reacting diphenhydramine free base at a temperature of about 75 to about 150° C. with tannic acid neat or as an aqueous slurry containing up to about 20 weight % water. The diphenhydramine free base may be obtained by reacting a com. available diphenhydramine salt such as diphenhydramine maleate with a base such as aqueous sodium hydroxide. The resultant diphenhydramine tannate has extended release properties and is useful in pharmaceutical compns. as an antihistamine for human beings.

AB Title preps., which are applied to the skin without soiling fingers, contain active ingredients, water-soluble polyols, higher fatty acid salts, water-soluble polymers, and water. Thus, an emulsion containing glycerin, 1,3-butylene glycol, carrageenan, xanthan gum, NaOH, palmitic acid, stearic acid, and clotrimazole was molded to give a skin-moisturizing nonirritating stick, which showed good storage stability at 50° for ≥1 mo.

AB	Isolated salts of acetaminophen are disclosed. Alkali metal and alkaline-earth metal salts of acetaminophen are formed by reacting the free acid of acetaminophen with the corresponding metal hydroxide and then immediately isolating the resulting salt. These salts have been found to be more water soluble and less bitter in taste than the free acid form of acetaminophen. The isolated salts may also be combined with other active ingredients. A tablet contained calcium acetaminophen 368.23, chlorpheniramine maleate 2, microcryst. cellulose 520.77, silica 4.5, and Mg stearate 4.5 mg.

AB An antihistamine free base is contacted with **tannic acid** in the presence of H₂O for 5 min to 4 h at a maximum temperature such that ≤5 weight % of the antihistamine tannate will be decomposed followed by freeze drying to remove ≥90% of the H₂O at a temperature and pressure such that decomposition is limited to ≤5%. Thus, phenylephrine was added over 15 min. to **tannic acid** in H₂O at 22° followed by stirring for 2 h. The mixture was then freeze-dried at 200-100 mtorr ant -50° to -40° for 36 h to give 96% phenylephrine tannate containing 2 weight% H₂O.

TITLE: Sorption properties of cross-linked insoluble poly(vinyl pyrrolidone)

AUTHOR(S): Froemming, K. H.; Ditter, W.; Horn, D.

CORPORATE SOURCE: Inst. Pharm., Freie Univ. Berlin, Berlin, 1000/33, Fed. Rep. Ger.

SOURCE: Journal of Pharmaceutical Sciences (1981), 70(7), 738-43

CODEN: JPMSAE; ISSN: 0022-3549

DOCUMENT TYPE: Journal

LANGUAGE: English

AB The interaction of 32 drugs of diverse chemical structure with crosslinked insol. poly(vinylpyrrolidone) (crospovidone) [9003-39-8] was studied. By using a polymer to drug ratio of 10:1, the sorbed amount for 20 compds. was <5%. After a 10-fold decrease of the polymer concentration, the sorbed amount of 8

other compds. fell to or below the 5% level. Only **tannic acid** and hexylresorcinol [136-77-6] exhibited a significantly stronger sorption tendency. The interaction appeared to be controlled by phenolic groups in the active ingredient. The binding can be quantified by an interaction constant, K_s, whose definition is based on a bulk phase model of interaction via independent binding sites. The exceptionally strong binding of hexylresorcinol, however, apparently was caused by cooperative interaction of the hexyl groups in the bound state. Desorption studies revealed that the binding was fully reversible in all cases. Therefore, the presence of crosslinked polyvinylpyrrolidone as a disintegrant in pharmaceutical prepns. is not expected to interfere with gastrointestinal drug absorption.
